

Sample App Screens: NativeAI

These are example screens from our prototype platform for data-collection and AI translation

1. Audio sample and feedback collection

This allows for the collection of vocal samples from users. Together with the API-based integration into Whatsapp - and other social media -, this serves to collect speech, conversations and stories to serve as raw training data.

Additionally, it allows for the rating and labeling of collected vocal samples from users and, if needed, allows users to provide improved submissions. This step is essential for feeding the automated training pipeline, which continuously improves the AI model.

2. Text translation and collection

This feature exposes a robust and cost-efficient text translation service, and enables the collection of text translation samples, feedback, and user suggestions to support continuous model improvement. The text translation component - already optimized for rapid iteration and cost-efficient scaling - is also integrated into the training process, to strengthen and improve the vocal models.
